Description

Using the SSH login method files are created in umask 0022. This, in my case, is not the logged in user's umask.

Setting a umask would be an essential feature in eXtplorer - especially in non-SSH logins. I think that until then it should use the user's default umask in SSH logins.

Or is the umask in SSH sessions determined by somewhere else in the stack, like PHP?
