Description

Hello,

when accessing to extplorer by webdav the files and directory are displayed in upper case and with the full path.

it happen only with some linux client :

- nemo (cinnamon desktop)
- thunar (xfce desktop)

it does not happen with cadaver CLI tools, nor with windows explorer
(i haven't tested unity/ubuntu nor gnome/nautilus)

i guess this behavior shows because theses tools are displaying the displayname property instead of the path .

however, it seems quite easy to fix :

```
in libraries/HTTP/WebDAV/Server/Filesystem.php  
replace ( line 215 )
```

```
$info["props"][] = $this->mkprop("displayname", strtoupper($path));
```

by

```
$info["props"][] = $this->mkprop("displayname", basename($path));
```

and folders and files are properly displayed.

i have tested ok with :

- windows explorer
- thunar
- nemo
- cadaver
- macOS finder

Best regards
